

## Project2 description

Jessica Shangcao Yuan

For this project is supposed to use kinect for 3d scan, manipulate the model and print the model out. I thought about scanning my friends because they will spend their time on scanning and help me to complete the project. So I would like to make this project for my friends. In Chinese, we have a word to describe friend, which is called "people are on the same boat and face to happiness and sadness together". I also found that in English, which is called "friendship". It seems like there is a culture similarity to describe friend. Thus, after I scanned all of my friends, I manipulated a small boat with a cow head and put three people together on the boat. The cow head in Chinese represents faithful, which is what we should be when we make friends. I was wondering the boat could float on the water, so I made the boat hollow inside. One thing I was worried about was when the model printed; I felt that my boat could not float because there was too much support material in the boat. However, I was so happy that it could float on the water. I wish if I had more time, I would make print a bigger one, and the characters on the boat could be cleaner.
